What is Serverless?

What is Serverless?

What is Serverless?

The Serverless Compute Manifesto

- Functions are the unit of deployment and scaling.
- No machines, VMs, or containers visible in the programming model.
- Permanent storage lives elsewhere.
- Scales per request. Users cannot over- or under-provision capacity.
- Never pay for idle (no cold servers/containers or their costs).
- Implicitly fault-tolerant because functions can run anywhere.
- BYOC – Bring your own code.
- Metrics and logging are a universal right.

@adrianco

Follow

If your PaaS can efficiently start instances in 20ms that run for half a second, then call it serverless.

Julz Friedman @doctor_julz

if you think serverless is different than PaaS then either you or I have misunderstood what "serverless" or "PaaS" means

Lambdas are almost always cheaper

FaaS
BaaS
DBaaS

Engineering Principles

The background of the slide is a reproduction of Michelangelo's famous fresco, 'The Creation of Adam'. It depicts Adam on the left, reclining and reaching towards God on the right, who is reclining and reaching back towards Adam. The two hands are just inches apart, creating a sense of tension and divine spark. The text 'Engineering Principles' is overlaid in large white font across the center of the image.

Aim to Open Source

Combining is easier than splitting

Serverless First

If serverless is not available or practical, containers are recommended.
Virtual servers (EC2) are considered legacy and should be avoided.

 v0.1.0

"Start with Why"
by Simon Sinek

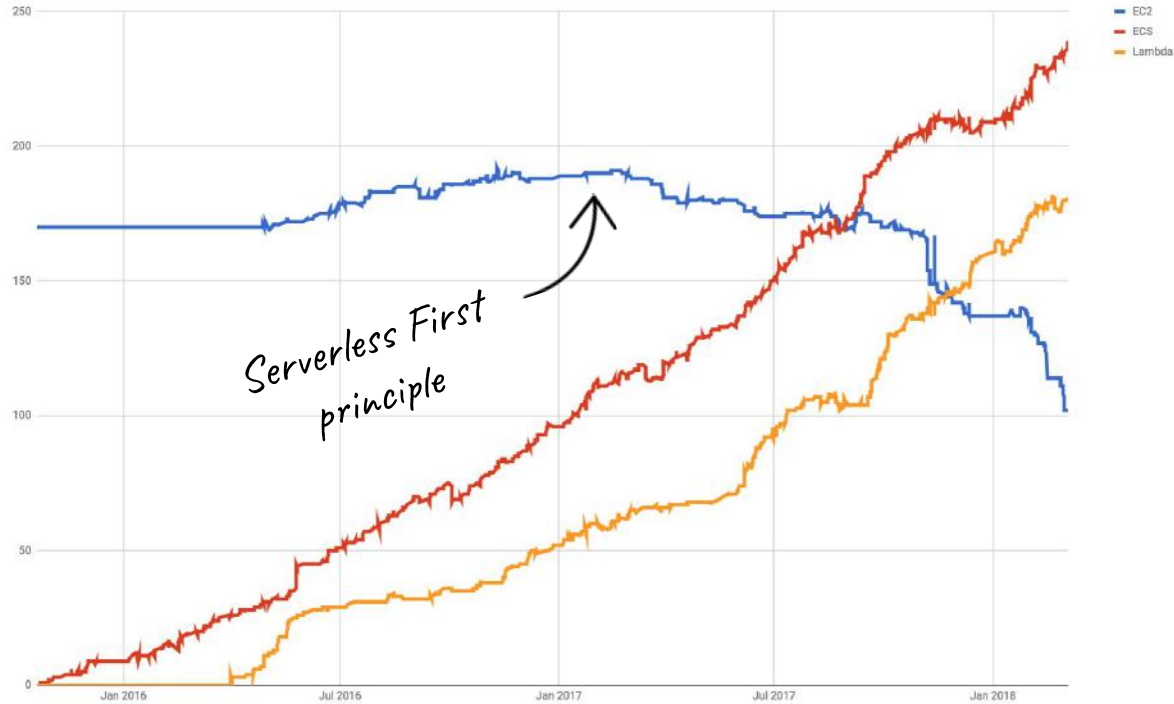

Serverless First

If serverless is not available or practical, containers are recommended.
Virtual servers (EC2) are considered legacy and should be avoided.

We do this because we strongly believe that serverless (FaaS, BaaS, DBaaS) is the future of the cloud and we'd like to be on the forefront of that movement. Serverless might not necessarily be the right choice for everything today, but start your architecture discussions there. We're in the process of fading out virtual servers (EC2) and want to avoid creating new ones. The benefits of serverless and containers over virtual servers are diverse: cost savings, better scaling, better orchestration, reduction of operational costs and modernizing our cloud stack.

- Simplifies deployment

EC2 GTFO

**GET
OUT!**

A photograph of a man with long, dark, curly hair, wearing a white t-shirt. He has a distressed or angry expression on his face. He is in a server room, with server racks and equipment visible in the background. The lighting is dim, with some yellowish light from the servers.

Serverless APIs

Lambda + API Gateway increased latency

Public APIs can make us vulnerable to DDOS

- Bad guys could potentially kill our Lambda infrastructure by exhausting invocation limits
- API Gateway supports rate limiting at the gateway level.

This is a must.

Learnings for us

Learnings

- + Event-based processing
- + Triggers (S3, IoT, DynamoDB, etc)
- + APIs
 - High loads
 - Data synchronization (streaming)
 - APIs (with low latency requirements)

Convenience is key

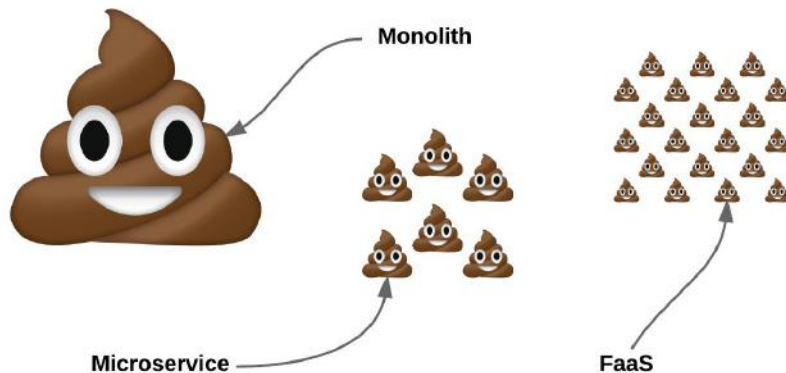

Future of Serverless

“We believe that Serverless is the natural evolution of cloud computing and will dominate it by 2020.”

Monolith vs Microservices vs FaaS
